

Silo storage of waste materials

Potato processing industry

Deswarte has built a silo in collaboration with Verschoore Construct for the new site of a producer of frozen potato products.

Collaboration Deswarte

This silo is intended for the storage of waste material, more specifically the potato shreds. It was fitted with three shaftless discharge screws, after which the product ends up in a press auger containing nets to further dewater the product. This results in a sharp reduction of the amount of water to be conveyed.
