

New extraction section with conveyors

Oil refinery

Deswarte has taken care of the engineering and assembly of a new extraction section for an oil refinery of vegetable oils. Chain conveyors were used for the supply and discharge of sunflower and corn germ meal from an installation already in use to a new one.

Collaboration Deswarte

We have installed five chain conveyors and a Z conveyor, including the supporting steel structures, for an entire length of no less than 152 metres. The installation was assembled at height with limited accessibility. This challenging project was carried out smoothly and without difficulty by our professionals.
